

Creamy Compressor™

Thank you for purchasing one of my Creamy Compressor™. This is the only Compressor that combines old technology with new!

It has more definition and clarity of individual notes. I have incorporated several different designs into this pedal. Some of the circuitry is very close to original studio gear and will produce a lot of the classic tube compression sounds. It is the Warmest, Smoothest Compressor you have ever heard, you can get any rhythm or solo to come Alive!

Operation:

When bypassed (Pressed IN) control doesn't work, and the module is in True bypass mode.

Activating pedal (Pressed OUT)

Peak Reduction:(Main Control)

The Peak Reduction controls the amount of compression, which causes the circuit to be more sensitive to your playing style. Between how high you have this control and the level of your guitar. You can dial in the amount of compression sound you want, and when you want it to come on.

Gain:(Inside trim Control)

The Gain is activated when the pedal is on; it controls the overall volume of the pedal, The Gain control can balance your guitar signal to unity, which is the same level that is coming out of your instrument, plus by turning it way up, will boost your instrument output.

Power:

The modules can be powered by a single 9 v battery.

You can power multiple modules on one battery.

Make Sure you unplug the Instrument after use to preserve battery life.
